0
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB DB

New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding modules.

Claim 8; Page 16; 18pp; German.

The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 02-JUL-1999 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                  Protein

   This invention describes novel polypeptides (I) that are muteins of bilin binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being simpler structure and are easier to prepare. They have a specificity for Dig, relative to other steroids, and fusion partners may be attached to either end without compromising their ability to bind 11-a-n
                                                                                                                                                                                                                                                                                                   New muteins of bilin-binding protein, useful for detecting digoxigenin being used as label in e.g. binding assays, are very selective for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             peptide loops (at one end of the cylindrical 'leaflet' structure). Anticalins can bind to a predetermined ligand with determinable affinity. Anticalins or fusions of anticalins, are used: (a) when immobilized, for separation; and (b) when labeled, for identification of ligands (or their fusions or conjugates). Typically they bind to tissue- or tumor-specific surface molecules and can be used for tumour imaging or directly for tumour therapy. Mutations can be introduced into lipocalin polypeptides more easily than into antibodies, since lipocalin polypeptides have only (contrast 6) sequence segments. The peptide loops can tolerate amino acid changes without significant effect on folding. Anticalins have high specific affinity, comparable with that for antibodies. This sequence represents a fusion polypeptide used in the method of the invention
                                                                                                                                                                                                                                                     Example 1; Page 55-56; 80pp; German.

                                                                                                                                 have an amino acid (aa) substitution at at least one of the positions 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 1125 or 127. (I), or i fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners m be attached to either end without compromising their ability to bind
                                                                                                                                                                                                                                                              This invention describes novel polypeptides (I) that are muteins of bilin-binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and
                                                                                                                                                                                                                                                                                                                                                      New muteins of bilin-binding protein, useful for detecting digoxigenin being used as label in e.g. binding assays, are very selective for
                                                                                                                                                                                                                                                                                                                                                                                                                                  Skerra A,

                                                                                                                            The present invention relates to a method for generating muteins of human neutrophil gelatinase-associated lipocalin (NNGAL), rat alpha2-microglobulin-related protein (A2m) or mouse 24p3/uterocalin, by subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the coat protein pIII of a filamentous bacteriophage of the M13-family of a fragment of the coat protein. The present sequence is the protein encoded by a fragment of plasmid pHNGAL5, used to illustrate the invention. This sequence comprises human hNGAL, a Strep-Tag II and a fragment of phage coat protein pIII.
                                                                                                                                                                                                                                                                                                                       Generating a mutein of a protein for validating the protein as drug target by subjecting the protein to mutagenesis at sequence positions corresponding to sequence positions of the human neutrophil gelatinase-associated lipocalin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mutein; human; neutrophil gelatinase-associated lipocalin; hNGAL; rat; alpha2-microglobulin-related protein; A2m; mouse; 24p3; uterocalin.

                                                                                                                       The present invention relates to a method for generating muteins of human neutrophil gelatinase-associated lipocalin (hNGAL), rat alpha2-microglobulin-related protein (A2m) or mouse 24p3/uterocalin, by subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the coat protein piII of a filamentous bacteriophage of the M13-family or for a fragment of the coat protein. The present sequence is the protein encoded by a fragment of plasmid pHNGAL3, used to illustrate the invention. This sequence comprises human hNGAL, a Strep-Tag II and a
                                                                                           Sequence 400 AA;
                                                                                                                                                                                                                                                                                                Generating a mutein of a protein for validating the protein as drug target by subjecting the protein to mutagenesis at sequence positions corresponding to sequence positions of the human neutrophil gelatinase-associated lipocalin.

given target, comprising subjecting the protein to mutagenesis at positions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in mutains of the protein. Also described: (1) a mutain of hNGAL, A2m or 2493 having detectable binding affinity to a given target, obtained by the method described above; (2) a fusion protein comprising the mutein of hNGAL, A2m or 2493, where an enzyme, a protein or a protein domain, a peptide, a signal sequence and/or an affinity tag is operably fused to the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the fusion protein of (2); and (4) a pharmaceutical composition comprising
                                                                                                                                                                                                                                                                             The present invention describes a method for generating a mutein of a protein selected from a human neutrophil gelatinase-associated lipocalir (hNGAL), rat alpha2-microglobulin-related protein (A2m) and a mouse 24p3/uterocalin (24p3), where the mutein has a detectable affinity to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Generating a mutein of a protein, e.g. human neutrophil gelatinase-associated lipocalin, rat alpha2-microglobulin-related protein or m 24p3/uterocalin, comprises subjecting the protein to mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27-SEP-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC the mutein of hNGAL, A2m or 24p3 or the fusion protein described above, CC and a carrier. The muteins have cytostatic activity, and can be used in CG gene therapy. The method is useful in generating or producing a mutein of CC hNGAL, A2m or 24p3 or a fusion protein. The mutein of hNGAL, A2m or 24p3 or a fusion protein. The mutein of hNGAL, A2m or 24p3 or a fusion protein. The mutein of hNGAL, A2m or 24p3 or a fusion protein. The mutein of hNGAL, A2m or 24p3 or conditions that allow complex formation between the mutein and the given conditions that allow complex formation between the mutein and the given CC target, and determining the complexed mutein by a suitable signal. The CC given target is a protein or protein domain, a peptide, a nucleic acid CC molecule, an organic molecule or a metal complex and the detection is C carried out for validation of the protein as a pharmacological drug CC target. The mutein may also be used in medicine, e.g. for tumour imaging CC target. The mutein may also be used in medicine, e.g. for tumour imaging CC target. The for cancer therapy. The present sequence represents a CC modified hNGAL, Strep-tag II and phage coat protein pIII fragment fusion or protein given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

CC given target, comprising subjecting the protein to mutagenesis at constituents 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in cc muteins of the protein. Also described: (1) a mutein of hNGAL, A2m or CC 2493 having detectable binding affinity to a given target, obtained by the method described above; (2) a fusion protein comprising the mutein of hNGAL, A2m or 2493, where an enzyme, a protein or a protein domain, a cc peptide, a signal sequence and/or an affinity tag is operably fused to the amino or carboxy terminus of the mutein of hNGAL, A2m or 2493 or the cc comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the fusion protein described above, and a carrier. The muteins have cytostatic activity, and can be used in c gene therapy. The method is useful in generating or producing a mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or the fusion protein is useful in generating or producing a mutein of hNGAL, A2m or 2493 or the fusion protein is useful in detecting a given target by contacting the mutein between the mutein and the given carget, and determining the complexed mutein by a suitable signal. The conditions that allow complex domain, a peptide, a nucleic acid molecule, an organic molecule or a metal complex and the detection is carried out for validation of the protein as a pharmacological drug target. The mutein may also be used in medicine, e.g. for tumour imaging cor directly for cancer therapy. The present sequence represents a modified hNGAL, Strep-tag II and phage coat protein pIII fragment fusion protein given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Generating a mutein of a protein, e.g. human neutrophil gelatinase-associated lipocalin, rat alpha2-microglobulin-related protein or m 24p3/uterocalin, comprises subjecting the protein to mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for generating a mutein of a protein selected from a human neutrophil gelatinase-associated lipocalin (hNGAL), rat alpha2-microglobulin-related protein (A2m) and a mouse 24p3/uterocalin (24p3), where the mutein has a detectable affinity to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2003-372000/35

```
CC protein selected from a human neutrophil gelatinase-associated lipocalin CC (hNGAL), rat alpha2-microglobulin-related protein (Azm) and a mouse CC (24p3) therocalin (24p3), where the mutein has a detectable affinity to a CC given target, comprising subjecting the protein to mutagenesis at CC given target, comprising subjecting the protein to mutagenesis at CC gositions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in CC positions of the protein. Also described: (1) a mutein of hNGAL, AZm or CC the method described above; (2) a fusion protein comprising the mutein of the protein and row repair the mutein of the mutein of cc peptide, a signal sequence and/or an affinity to a given target, obtained by CC peptide, a signal sequence and/or an affinity tag is operably fused to CC peptide, a sequence encoding the mutein of hNGAL, AZm or 24p3 or the comprising a sequence encoding the mutein of hNGAL, AZm or 24p3 or the comprising a sequence of (2); and (4) a pharmaceutical composition comprising CC and a carrier. The muteins have cycostatic activity, and can be used in CC and a carrier. The muteins have cycostatic activity, and can be used in CC gene therapy. The method is useful in generating or producing a mutein of hNGAL, AZm or 24p3 or a fusion protein. The mutein given target under the fusion protein is useful in detecting a given target by contacting cor the fusion protein is useful in detecting a given target by contacting cor the fusion protein of containing the complex domain, a peptide, a nucleic acid conditions that allow complex formation between the mutein and the given target, and determining the complexed mutein by a suitable signal. The conditions that allow complex formation between the mutein and the given carried out for validation of the protein domain, a peptide, a nucleic acid conditions and conditions and the detection is modified hNGAL, Strep-tag II and phage coat protein invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bilin binding-protein associated protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAB46427 standard; protein; 659
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel polypeptides (I) that are muteins of bilin-binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, have an arrival at the substitution at at least one of the positions 28, 13, 34-37, 58, 60, 69, 88, 90, 95, 97, 114, 116, 125 or 127, (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, separate Dig or the conjugates with proteins, nucleic acids, separates, other biological or synthetic macromolecules or low carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other storoids, and fusion partners may be attached to either end without compromising their ability to bind light.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bilin-binding

                                                                                                                                                                                                                    The invention relates to a novel isolated, modified ADAMTS4 (a disintegrin-like and metalloprocease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of the furin-processed human aggrecanase ADAMTS4 truncated protein with Strep tag of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated, modified ADAMTS4 (aggrecanase) protein with improved stability useful for identifying inhibitors of the enzyme activity fo treating aggrecanase-associated conditions, including osteoarthritis.

The invention relates to a novel isolated, modified ADAMTS4 (a disintegrin-like and metallogrotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAWTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAWTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrate osteopathic, antiinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of the human aggrecanase ADAWTS4 truncated protein with Strep tag of the invention.
                                                                                                                                                                                                                                                                                                                           New isolated, modified ADAMTS4 (aggrecanase) protein with improved stability useful for identifying inhibitors of the enzyme activity for treating aggrecanase-associated conditions, including osteoarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       aggrecanase; osteopathic; antiinflammatory; antiarthritic; antirheuma cytostatic; osteoarthritis; glioma; cancer; inflammatory joint; rheumatoid arthritis; septic arthritis; periodontal; Crohn's disease;

disintegrin-like and metallogrotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metallogroteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antiinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of the human aggrecanase ADAMTS4 mutant E362Q protein with
                                                                                                                                                                                                                                                                               New isolated, modified ADAMTS4 (aggrecanase) protein with improved stability useful for identifying inhibitors of the enzyme activity for treating aggrecanase-associated conditions, including osteoarthritis.
                                                                                                                                                                                                                                                                                                                                                  WPI; 2004-143860/14.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                        The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, e.g. on protein chips or microtritre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor: (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                         New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding modules.
                                                                                   Sequence

                                                                                                                                                                                                     The invention relates to a method for producing a protein array made by CC transcription and translation of DNA, or by translation of mRNA, by a CC cell free system in vitro to produce individual proteins, domains or CC cell free system in vitro to produce individual proteins, domains or CC peptides distributed in a gridded format. The peptides of the invention CC contain amino acid sequences enabling covalent/non-covalent attachment to contain amino acid sequences enabling covalent/non-covalent attachment to contain amino acid sequences enabling covalent/non-covalent attachment to complete the grid format covalent interaction of the grid format covalent interaction of the grid format covalent for interactions of the covalent system is useful for identifying interactions of the covalent of the groteins or domains, peptides, small ligands, cell extracts and nucleic covalents. The protein array is also useful for identifying interactions of covalent protein array is arrayed protein with other molecules displayed in a library such as a covalent for studying cellular protein expression profiles and post-covalent in a protein array is considered to the covalent covalents a protein of a double hexahistidine with a flexible covalence of the covalence of the covalence and post-covalence covalence and post-covalence of the covalence of

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4, Application US/09977137A

Patent NO. 6750042

GENERAL INFORMATION:

APPLICANT: Summers, Anne O.

APPLICANT: Caguiat, Jonathan

ITILE OF INVENTION: Metal Binding Proteins, R.

ITILE OF INVENTION: Methods

FILE REFERENCE: 79-00

CURRENT APPLICATION NUMBER: US/09/977,137A

CURRENT FILING DATE: 2001-10-12

PRIOR APPLICATION NUMBER: US 60/240,465

PRIOR APPLICATION NUMBER: US 60/240,465

PRIOR FILING DATE: 2000-10-12

NUMBER OF SEQ ID NOS: 18

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 4

LENGTH: 117

TYPE: PRT

ORGANISM: Artificial Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SOFTWARE: PatentIn version 3.0 SEQ ID NO 31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 31, Application US/09809517A

Patent No. 6753136

GENERAL INFORMATION:

APPLICANT: Lohning, Corinna

TITLE OF INVENTION: No. 6753136el methods for displaying (poly)peptides/proteins on TITLE OF INVENTION: particles via disulfide bonds

PILE REFERENCE: MORPHO//1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -09-809-517A-31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SOFTWARE: P
